

PT Surya Esa Perkasa Tbk.

INFORMATION DISCLOSURE

In connection with our previous notification dated October 21, 2021, where we have informed that the Banggai Ammonia Plant Turnaround (BAP) maintenance scheduled to be carried out starting on October 11, 2021 has been going well so far.

Turnaround Maintenance is a very important activity for the sustainability of the factory and is carried out when the factory is in a state of shutdown, including replacement and corrective maintenance of equipment and catalysts, which usually can be completed in about 1 (one) or even up to 3 (three) months depending on from the findings what needs to be repaired or replaced. Therefore, although the Company hopes to complete the maintenance as soon as possible, judging from the current conditions in the field, it is estimated that the turnaround maintenance will only be completed properly and as expected in December 2021.

This Turnaround Maintenance activity is the first time that BAP has carried out since the factory facility started operating in August 2018. Since BAP is the only one in the world that utilizes the latest technology to produce ammonia called 'KBR Reforming Exchanger System and Purifier Technology' (KBR), the KBR team as a technology partner has been in the field since the beginning to supervise maintenance activities, especially to ensure that the factory facilities will run optimally after this activity.
